

RFP-016: Food Truck Order and Route Planner

Client: Street Corner Eats

Company Background • Street Corner Eats operates two food trucks that rotate between office zones and weekend events. • The owner wants better coordination between pre-orders, stock planning, and daily route decisions.	Current Situation • Pre-orders arrive from social media messages and phone calls. • Drivers choose daily stops based on habit rather than a structured plan.
Business Problem • Staff cannot see demand clearly enough to plan inventory or truck assignments. • Customers receive inconsistent updates about where trucks will be and when orders are ready.	Desired Outcome • A simple system for pre-order intake, route planning, and order-status visibility. • A daily planning view that helps the owner decide where each truck should go.
Constraints • The MVP should use manual route planning rather than algorithmic optimization. • The first version is internal operations software with optional customer-facing order lookup.	Deliverables Expected • Order and route planning application • Truck schedule view • Operational guide and QA evidence
Suggested User Roles • Owner or dispatcher • Truck operator • Kitchen prep staff	Suggested MVP Scope • Order intake and pickup scheduling • Truck route plan for the day • Order status updates and simple inventory notes
Out-of-Scope Warning • Do not build live GPS, online payments, or advanced delivery optimization. • Avoid full restaurant POS replacement.	

RFP-016 Planning Notes

How To Use This RFP

- Start by restating the business problem in your own words.
- Define a small MVP that solves the core workflow end to end.
- Track assumptions, risks, and stakeholder questions before implementation starts.
